

# A REVOLUTIONARY CHANGE

A revolutionary change and landmark development in the history of weather forecasting and the supply and demand of forecast information to the general public has quietly begun. With the development of computers, the science of Meteorology and the skill and accuracy of weather forecasting has grown and improved significantly. In addition, with the advancement of the broadcast/print media and the internet, never has there been a greater time and demand for clear, accurate, detailed weather forecasts to the public.

However, the way that the civil service, private sector and the media provides weather information and forecasts to the masses has *not* changed. The general public continues to have to deal with generalized, vague descriptions and graphical representations of the weather forecast (i.e., "chance of", "scattered", "partly cloudy/partly sunny" or the cloud/sun/raindrop symbol, etc...), and it's left up to you to try to understand and figure out what all of this means. As a result, interpretations of the forecast are different, and the public is left with poor, inaccurate weather forecasts and the weatherman is given his typical bad reputation.

(including start and ending times), visibility, barometric pressure and the amount of sunshine for any requested city for any specific time frame that you request! This is unfounded territory in the history of providing productive weather information and forecasts to the public and will finally give people the important information that they have been looking for!

So, if you're a June Bride who needs to know what the weather will be like from 2 to 5 PM, if you're involved in an important construction (or snow removal) project or if you're just planning an outdoor picnic, you will FINALLY not be confused, misled or disappointed.

But now, for the first time, this is about to change. Emmy Award winning Meteorologist Jeff Mendelson has begun a revolutionary method of relaying important weather forecasts to the general public. His new company, SKYS THE LIMIT WEATHER, will relay DETAILED descriptions of the future behavior of various weather parameters for INDIVIDUAL CITIES on an HOURLY BASIS.

SKYS THE LIMIT WEATHER will be able to provide detailed information about temperature, humidity, wind, sky, precipitation
